

Activate Intel Virtualization

You can enable **Virtualization** on your system as your machine supports it.

Every vendor has different steps to do this, so I am not sure how to do it on your machine.

Anyways, you can try the following steps:

1. Reboot your machine
2. Before your machine starts loading your operating system, press F2 (or button which says setup).
3. This will open Bios settings on your machine.
4. You may find an option in your BIOS named **Intel virtualization** or **Intel vt-x**.
5. Enable it and save the changes.

Here is one link which might help:
